

THERMAFLEECE™

Sheep's Wool Thermal Insulation

WHY WOOL INSULATION IS BEST

Wool is a natural fibre from a fully renewable resource, consequently the life cycle of the product has an ideal energy balance. THERMAFLEECE wool insulation helps to keep buildings cool in summer and warm in winter.

THERMAFLEECE can absorb and desorb water vapour without effecting its thermal efficiency. When the exterior temperature increases the wool releases moisture that reduces the flow of heat to the inside of the building. This can reduce the peak temperature by up to 7°C.

In the winter the absorption of moisture can increase the peak temperature by up to 4°C.

SAFE, DURABLE & RECYCLABLE

THERMAFLEECE is harmless and is not harmful to skin, eyes or respiratory tract. Any fibres that do happen to reach the living space will present no hazard to health. The necessary insect proofing and fire resistance rating is achieved with naturally derived additives.

When correctly installed, THERMAFLEECE will retain its low density and thermal performance. Its life expectancy is similar to that of the construction in which it is installed.

THERMAFLEECE can be recycled for other environmentally friendly applications once it has come to the end of its useful life.
